

Based Upon: PCT/EP2004/013504

ABSTRACT OF THE DISCLOSURE

A lock with a bolt, arranged in a lock housing. The bolt may be adjusted between an open and a closed position, by a closing element, and the closing element may be locked in a closed position, by a locking element. The locking element is coupled to an armature of an electromagnet and may be operated by the same. For better protection against manipulation for such a lock, the armature and/or the electromagnet are at least partly covered by at least one screening element, arranged in, or on the housing, which can be made from a soft magnetic material.
